

$$\Delta H = -566 \text{ kJ}$$

⊖ means exothermic

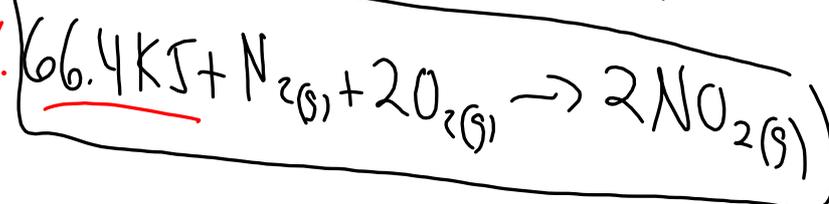

heat released

end heat gained.

$$\Delta H = +66.4 \text{ kJ}$$

① Find  $\Delta H$  for  $\text{CO}_2 \text{(g)}$  in  $\text{kJ/mole}$ .

566 kJ	1 mole $\text{O}_2$
2 mole $\text{CO}_2$	

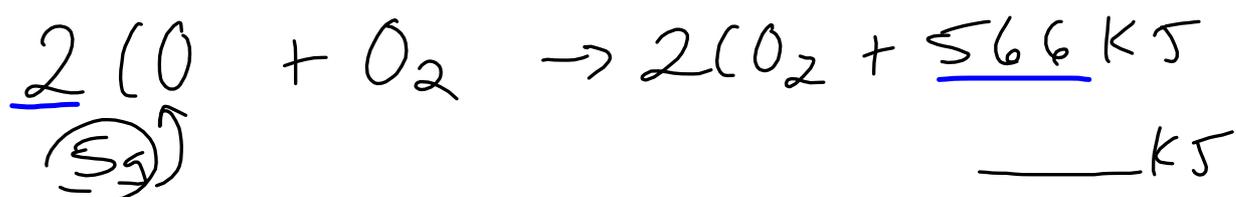

$$\frac{283 \text{ kJ}}{\text{mole}}$$

$\Delta H$  is part of the  
MOLE RATIO

$$\frac{566 \text{ kJ}}{2 \text{ mole } \text{O}_2} = \frac{283 \text{ kJ}}{1 \text{ mole } \text{O}_2}$$

<del>2 mole <math>\text{O}_2</math></del>	566 kJ
1 mole <del><math>\text{O}_2</math></del>	

2 mole $\text{O}_2$
$2(566) = 1132 \text{ kJ}$

<del>5g CO</del>	<del>1 mole CO</del>	566 kJ	=	50.5 kJ
<del>28g CO</del>	<del>2 mole CO</del>
