

Steps of Hair Growth

① Anagen phase → Active hair growth

cells divide in follicle (bulb)
get pushed upward (hair growth)

2nd in growth rate only to bone marrow. FAST

Scalp ~ 4 → 5 years → (~1/2" per month)

Ayebrow -) ~ 3 months → (~0.3mm/day)

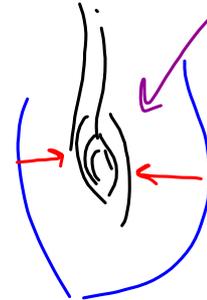

Dec 19-10:14 AM

② Catagen phase - Transition period

↳ change from growing to no longer growing ^{no more new cells.}

→ growth area of follicle in the bulb shrinks

~3 → 4 weeks

Club like appearance

Dec 19-10:28 AM

③ Telogen phase - Final "growth" phase
 few days → week Resting period for follicle

- root has shrunk → hair falls out
 not strongly held. (root system dies)

lose 50-100 scalp/day

Aug # hairs 150,000 → 200,000

Dec 19-10:34 AM

④ Exogen no longer a "growth" phase.

Death's waiting room.

Waiting for the Telogens to fall out.

↳ New Anagen phase begins.

Dec 19-10:39 AM

Genetic differences

① Asian (Mongloid)

Cross section
Rounder

↳ Thicker shaft - more straight.

↳ less dense on scalp

② White (Caucasoid) → oval / cross section
More durable to bending.

Dec 19-10:45 AM
